```
# general use
library(here)

library(tidyverse)

library(janitor)

library(snakecase)

# packages for visualization customization

library(scales)
library(paletter)
library(ggthemes)
library(RColorBrewer)

# reading in .xlsx files
library(readxl)

# taxonomic information
taxon_list <- read_csv(here("data", "taxon_list.csv"))

# aquatic invertebrates
aq_ins <- read_xlsx(here("data", "Aquatic Sampling Data-2026-03-10.xlsx"),
                   sheet = "Aquatic Insects")

# site information
sites <- read_xlsx(here("data", "Aquatic Sampling Data-2026-03-10.xlsx"),
                  sheet = "sites")
```

```
# water quality information
water_quality <- read_xlsx(here("data", "Aquatic Sampling
  ↪ Data-2026-03-10.xlsx"),
                           sheet = "Water Quality",
                           na = c("", "n/a", "N/A", "over", "173+"))
```

#1. Explain

- I chose the most popular Ikea designers visualization because I felt that it would be a good type of visualization to showcase the most abundance invertebrate species at NCOS.
- This visualization makes sense for this the invertebrate visualization because there are 15+ different designers, which is similar to how many different taxa there are. And the different sized bars can account for differences in abundance.
- All Taxa will be shown in my visualization. There will be a different color for each taxon, and the amount of the color will show how abundant they show up in samples.

#2. Plan

```
# adds in jpeg
knitr::include_graphics(here("data", "plan.jpeg"))
```

#3. Code

```
# creating new object from sites
ncos_sites <- sites |>
```

```
# filter to only include NCOS quarterly sampling sites
filter(sector == "NCOS" & sampling_frequency == "Quarterly")
```

```
water_quality_clean <- water_quality |>
```

```
# cleaning column names
clean_names() |>
```

```
# filtering join: only include sites in ncos_sites
# keep all the rows on the left that match up with rows on the right
semi_join(ncos_sites, by = "site") |>
```

```
# combine date and site together and remove those indiv. columns
unite("date_site", date, site, remove = TRUE) |>
```

```
# group by date_site
group_by(date_site) |>
```

```
# create new columns that show median of each variable at each date_site
# because there are multiple samples at the same site at different depths
summarize(med_ph = median(p_h, na.rm = TRUE),
          med_sal = median(salinity_ppt, na.rm = TRUE),
          med_do = median(dissolved_oxygen_mg_l, na.rm = TRUE)) |>
```

```
# ungroup
ungroup() |>
```

```
# filter out the salinity outlier
filter(date_site != "2022-08-12_NVBR")
```

```
# creating new object from taxon_list
taxon_list_clean <- taxon_list |>
```

```
# converted taxon name values to snake case (lowercase)
mutate(verbatim_name = to_any_case(verbatim_name,
                                   case = "snake"))
```

```

4. Process

- The process of using someone else's code was a little difficult as I had to go through each line of code to see what the code did.
- A challenge I encountered was the lack of comments in the R file that I used.
- This visualization is different since it shows just one variable in bars in a circular shape without any axes.
